RESULT 5
JN0686
calgranulin B - rat
NyAlternate names: calcium-binding protein MRP-14; macrophage migration inhibitory factor.
C;Species: Rattus norvegicus (Norway rat)
C;Species: Diamay-1994 #sequence_revision 23-May-1997 #text_change 09-Jul-2004
C;Accession: JN0686
R;Imamichi, T.; Uchida, I.; Wahl, S.M.; McCartney-Francis, N.
Biochem. Biophys. Res. Commun. 194, 819-825, 1993
A;Title: Expression and cloning of migration inhibitory factor-related protein (MRP)8 as A;Title: Expression: JN0685; MUID:93343942; PMID:8343166
A;Molecule type: mRNA
A;Residues: 1-113 < ram,A
A;Residues: 1-113 < ram,A
A;Residues: 1-113 < ram,A
A;Coss-references: UNIPROT:P50116; GB:L18948; NID:9488156; PIDN:AAA18214.1; PID:948815.
C;Genetics
A;Gene: MRP:
C;Complex: heterodimer and higher complexes with calgranulin A
C;Superfamily: 5-100 protein; calmodulin repeat homology < REP hand; heterodimer; inflammation; F;1-145/Domain: calmodulin repeat homology < REP;2
C;Complex: calmodulin repeat homology < REP;2
F;2-113/Product: calmodulin repeat homology < REP;2
F;2-100main: calmodulin repeat homology < REP;2
F;2-100main: calmodulin repeat homology < REP;2
F;2-100main: calmodulin repeat homology < REP;2
F;2-Modified site: accetylated amino end (Ala) (in mature form) #status predicted
F;80-91/Disulfide bonds: #status predicted
A;Cross-references: GDB:120570; OMIM:123886
A;Map position: 1q21-1q21
A;Introns: 50/3
A;Introns: 50/3
A;Note: the first intron occurs before the initiator codon
C;Complex: heterodimer and higher complexes with calgranulin A (see PIR:BCHUCF)
C;Superfamily: S-100 protein; calmodulin repeat homology
C;Keywords: blocked amino end; calcium binding; EF hand; heterodimer; inflammation;
F;2-114/Product: calgranulin B #status experimental <MAT>
F;10-44/Domain: calmodulin repeat homology <EF1>
F;54-86/Domain: calmodulin repeat homology <EF2>
F;54-86/Domain: calmodulin repeat homology <EF2>
F;2/Modified site: blocked amino end (Thr) (in mature form) (probably acetylated) #s
F;113/Binding site: phosphate (Thr) (covalent) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GACCTGGATGCCGATAAAGACGGAGCCGTCAGCTTTGAGGAATTCGTAGTCCTGGTGTCC 237

NyAlternate names: calcium-binding protein MRP-8; macrophage migration inhibitory factor
C.Species: Rattus norvegicus (Norway rat)
C.Species: Rattus norvegicus (Norway rat)
C.Accession: JN0685
R;Imamichi, T.; Uchida, I.; Wahl, S.M.; McCartney-Francis, N.

The 23-Kilddalton protein, a substrate of protein kinase C, in bovine neutrophil dytosol is a member of the S100 family.";

Blochemistry 31:5898-5905(1992)

- SUBCBLULAR LOCATION: Cytoplasmic; loosely associated to the cytoskeleton.

- SUBCBLULAR LOCATION: Cytoplasmic; loosely associated to the cytoskeleton.

- TISSUE SPECIFICITY: Found essentially in phagocytic cells.

- SIMILARITY: Belongs to the S-100 family.

- SIMILARITY: Belongs to the S-100 family.

- SIMILARITY: Belongs to the S-100 family.

- I SIMILARITY: Contains 2 EF-hand calcium-binding domains.

J. Mol. Biol. 325:785-794(2003).
-!- SUBUNIT: Homodimer. Interacts with S100Z.
-!- MISCELLANEOUS: This protein binds two calcium ions.
-!- SIMILARITY: Belongs to the S-100 family.
-!- SIMILARITY: Contains 2 EF-hand calcium-binding domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bovine; EN-RAGE, extracellular novel RAGE binding protein; receptor for advanced glycation endproduct; inflammation; inhibition; antiinflammatory; immunoglobulin; cell surface molecule; septic shock; systemic lupus erythematosus; inflammatory lupus nephritis; endotoxaemia; autoimmune disorder; inflammatory disorder.
                                                                       This sequence represents the CAAFI calcium-binding protein isolated from bovine amniotic fluid. CAAFI belongs to the S100 protein family, which includes calcyclin, MRPB, and MRP14. Intracellular calcium ion concentration is one of the key factors for intracellular signal transduction. The calcium signals are transduced by various calciumbinding proteins, such as the protein encoded by this sequence. CAAFI is normally expressed in squamous epithelial cells, neutrophils and macrophages, but atypical epithelial cells are negative for CAAFI and overexpression is observed in several types of cancer cells and neutrophils/macrophages infiltrating cancerous lesions. Detection of carcinomical inflammation, neoplasia (particularly squamous cell carcinoma of the skin, oesophagus, lung and cervix), and skin and blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        40

New human EN-RAGE (extracellular novel receptor for advanced glycation end products) peptide, useful for identifying anti-inflammatory compounds that inhibit its interaction with RAGE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               123
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     183
                                                                                                                                                                                                                                           The present invention describes an isolated human EN-RAGE (extracellular novel receptor for advanced glycation end products) peptide (P1). The EN-RAGE peptide binds to RAGE which is a member of the immunoglobulin superfamily of cell-surface molecules. A compound capable of inhibiting the interaction of EN-RAGE with RAGE is useful for the suppression of inflammation resulting from systemic lupus erythematosus, inflammatory lupus nephritis, septic shock, endotoxaemia, or an autoimmune or inflammatory disorder in which the recruitment of EN-RAGE containing inflammatory cells occurs. The compound is also useful for the treatment of systemic lupus erythematosus, inflammatory lupus nephritis in a subject. The human EN-RAGE peptide is useful for identifying compounds that inhibit its interaction with RAGE. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GATGCCGATAAAGACGGAGCCGTCAGCTTTGAGGAATTCGTAGTCCTGGTGTCCAGGGTG

```

The present invention describes an isolated human EN-RAGE (extracellular novel receptor for advanced glycation end products) peptide (P1). The EN-RAGE peptide binds to RAGE which is a member of the immunoglobulin superfamily of cell-surface molecules. A compound capable of inhibiting the interaction of EN-RAGE with RAGE is useful for the suppression of inflammation resulting from systemic lupus erythematosus, inflammatory lupus nephritis, septic shock, endotoxaemia, or an autoimmune or inflammatory disorder in which the recruitment of EN-RAGE containing inflammatory cells occurs. The compound is also useful for the treatment of systemic lupus erythematosus, inflammatory lupus nephritis in a subject. The human EN-RAGE peptide is useful for identifying compounds that inhibit its interaction with RAGE. The present sequence represents the bovine corneal antigen which shows homology to the human EN-RAGE Nterminal amino acid sequence

A novel bioactive metal RNA polypeptide (RNP) has a RNA component including the sequence AAT62568 and a polypeptide component having the sequence AAW01826, which is encoded by AAT62569. The RNP, or anti-RNP immunoglobulins, can be used to modulate and/or analyse angiogenesis and the vascular state of mammalian tissue, transfer genetic information in cells and selectively alter the nucleic acid content of cells. Leukocytes from pig's blood were cultured in medium, and the supernatant treated with NH4 sulphate at 35, 45 and 90% saturation to precipitate protein fractions. The residual supernatant was diltued to 45% NH4 sulphate saturation and concentrated by ultrafiltration using a 0.5 kD membrane.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ACTAAGCTGGAAGATCACCTGGAGGGAATCATCAACATCTTCCACCAGTACTCCGTTCGG

describes novel copper-containing ribonucleoproteins which omplexes of an S100 protein, copper ions, and RNA comprising consensus sequence or its complement GGAAAUNNNNNUAUGNI-NAAAANO-1UANAAACAUNO-5CUUNAGNO-13AGAA-AUNO-16UUAGCAG where C. The ribonucleoproteins are stated to have the following cell-selective morphogenic action in vitro on isolated closed blood capillary endothelial cells in culture for inclinduction of the change in cell phenotype from the ce, for non-mitogenic alteration of the spatiotemporal organisation of cells into three-dimensional organoid, structures in culture, (2) a specific chemotropic action is in vivo, (3) induction of directional growth of blood of and (4) induction of neovascularisation of tissues
                                                                                            243

CAAF1 belongs to the S100 protein family, which includes calcyclin, MRP8, and MRP14. Intracellular calcium ion concentration is one of the key factors for intracellular signal transduction. The calcium signals are transduced by various calciumbinding proteins, such as this protein. CAAF1 is normally expressed in

squamous epithelial cells, neutrophils and macrophages, but atypical epithelial cells are negative for CAAFI and overexpression is observed is several types of cancer cells and neutrophils/macrophages infiltrating cancerous lesions. Detection of CAAFI (using antibodies in usual immunoassays) can be used to diagnose (or monitor) inflammation, neoplasia (particularly squamous cell carcinoma of the skin, oesophagus, lung and cervix), and skin and blood diseases

This is a human chemotactic cytokine I polypeptide. The encoding polynucleotide, along with a vector and a host cell can be used for the recombinant production of the chemotactic cytokine. Cytokine agonists and antagonists can be used for the treatment of a patient requiring a chemotactic cytokine I and for the treatment of a patient requiring the inhibition of a chemotactic cytokine I polypeptide, respectively. The chemotactic cytokine is used to treat tumours, chronic infection, leukaemia and T-cell mediated autoimmune diseases
                                                                                                                                                                                                                                                                                                                     120

XX
Composition containing S100 protein, corresponding nucleic acid or
Y vector, useful for treating cardiomyopathy and cardiac insufficiency.

XX
Claim 35; Page 20; 36pp; German.

XX
This invention describes a novel composition for treating primary or
CC sloop protein (I) or nucleic acid (II) encoding (I), or their mutants or
CC sloop protein (I) or nucleic acid (II) encoding (II), or their mutants or
CC formulated with auxiliaries and/or carriers. (I) are calcium-binding

The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polynucleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GM2 activator, calgranulin B or saposin B protein the ganglioside GM2 activator, calgranulin B or saposin B protein active, neurological and/or auto-immune disease. The degenerative, neurological and/or auto-immune disease. The polynucleotides and polypeptides are used for diagnosis, prognosis, proynucleotides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and plases). They may also be useful in cases of e.g. Alzheimer's and polypeptides are used to assess, amyotrophic lateral sclerosis, rheumatoid planking and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
Alzheimer's disease; Parkinson's disease; amyotrophic lateral sclerosis; rheumatoid polyarthritis; lupus erythematosus; gene therapy.
                                                                                                                                                                                                                                                                                                                                                             Detecting, preventing and treating degenerative, neurological and autoimmune diseases, particularly multiple sclerosis, using specified polypeptides or related nucleic acid or ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MetThrLysLeuGluGluHisLeuGluGlylleValAsnllePheHisGlnTyrSerVal

The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polynucleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GM2 activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polynucleotides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and construction and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
                                                                                                                                                                   Human, perlecan; retinol-binding plasma protein; calgranulin B; vaccine; ganglioside GM2 activator; saposin B; degenerative disease; glial cell; neurological disease; auto-immune disease; multiple sclerosis; toxicity; Alzheimer's disease; Parkinson's disease; amyotrophic lateral sclerosis; rheumatoid polyarthritis; lupus erythematosus; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting, preventing and treating degenerative, neurological and autoimmune diseases, particularly multiple sclerosis, using specified polypeptides or related nucleic acid or ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Perron

The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polynucleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the retinol-binding plasma protein, precursor of the ganglioside GM2 activator, calgranulin B or saposin B protein the ganglioside GM2 activator, calgranulin B or saposin B protein cagenerative, neurological and/or auto-immune disease. The polynucleotides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and polymenting as a socious solution and treatment of multiple sclerosis, rheumatoid parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells CTTCCCAAAACCCTCCAGAACACCAAAGATCAACCTACCATTGACAAAATATTCCAAGAC 180 9 Human, perlecan; retinol-binding plasma protein; calgranulin B; vaccine; ganglioside GM2 activator; saposin B; degenerative disease; glial cell; neurological disease; auto-immune disease; multiple sclerosis; toxicity; Alzheimer's disease; Parkinson's disease; amyotrophic lateral sclerosis; rheumatoid polyarthritis; lupus erythematosus; gene therapy. CTGGATGCCGATAAAGACGGAGCCGTCAGCTTTGAGGAATTCGTAGTCCTGGTGTCCAGG specified and Detecting, preventing and treating degenerative, neurological autoimmune diseases, particularly multiple sclerosis, using sp polypeptides or related nucleic acid or ligand. to be treated or prevented. Calgranulin C has antiinflammatory activity and can be used in gene therapy. The method is useful for diagnosing, treating or prevented. Calgranulin C has antiinflammatory activity and can be used in gene therapy. The method is useful for diagnosing, treating or preventing inflammatory diseases, e.g. vasculitis (particularly Kawasaki disease), cystic fibrosis, chronic inflammatory atthritis or Crohn's disease, chronic bronchitis, inflammatory arthritis (e.g. psoriatic arthritis, rheumatoid arthritis or seronegative arthritis), systemic onset juvenile rheumatoid arthritis or Soura or Still's disease), acute inflammation above the background of a chronic inflammatory disease, or an exacerbation of an already present disease. The method is also useful for diagnosing specific stages of inflammatory diseases, for determining the risk of relapse, and for discriminating between diseases with similar symptoms. The present sequence represents human calgranulin C, which is used in the exemplification of the present 120 180 treating 40 9 20 CITCCCAAAACCCTCCAGAACACCCAAAGATCCTACCATTGACAAAATATTCCAAGAC CTGGATGCCGATAAAGACGGAGCCGTCAGCTTTGAGGAATTCGTAGTCCTGGTGTCCAGG ATGACTAAGCTGGAAGATCACCTGGAGGGAATCATCAACATCTTCCACCAGTACTCCGTT CGGGTGGGGCATTTCGACACCCTCAACAAGCGTGAGCTGAAGCAGCTGATCACAAAGGAA |||| |LeuAlaAsnThrIleLysAsnIleLysAspLysAlaValIleAspGluIlePheGlnGly 1 MetThrLysLeuGluGluHisLeuGluGlyIleValAsnIlePheHisGlnTyrSerVal present in the biological sample.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, PRO; immune related disorder; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; juvenile chronic arthritis; systemic sclerosis; Sjogren's syndrome; vasculitis; sarcoidosis; autoimmune haemolytic anaemia; autoimmune thrombocytopenia; thyroiditis;
                                                                                                                                                                        The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention.

Novel PRO polypeptide e.g., PRO69614, PRO71106, or PRO86388 useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to human PRO polypeptides and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for treating and diagnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic sclerosis, Sjogren's syndrome, vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central or peripheral nervous system, demyelinating polyneuropathy, Guillain-Barre syndrome and chronic inflammatory demyelinating polyneuropathy. This sequence represents a human PRO polypeptide of the

New isolated polynucleotides and polypeptides associated with NF-kappaB pathway, useful for diagnosing, treating, or preventing disorders or diseases associated with NF-kappaB pathway.

English SEQ ID NO 334; 237pp;

This invention relates to the novel association of protein sequences (and the genes which encode them) to the NF-kappaB pathway. The invention may be useful for the production of compounds with an antiinflammatory, be useful for the production of compounds with an antiinflammatory, cytostatic, hepatotropic, virucide, antiarthitic, antirheumatic, gastrointestinal-Gen, antiasthmatic, antiarthritic, antirheumatic, carebroprotective, vasotropic, immunosuppressive or useful for diagnosing, preventing, treating, or ameliorating conditions or diseases associated with the NF-kappaB pathway. The conditions an imflammatory disorder, an inflammatory disorder, related to aberrant NF-kappaB regulation, cancer, aberrant apoptosis, related to aberrant dysplasia, immunodeficiency, viral infections, hyper-light syndromes, hypohidrotic ectodermal dysplasia, X-linked anhidrotic ectodermal dysplasia, immunodeficiency, viral infections, HIV-1, HTLV-1, hepatitis E, hepatitis C, EBV, influenza, viral replication, host cell survival, evasion of immune disorders, disorders related to aberrant acute phase responses, concern immune activity, disorders related to aberrant acute phase responses, corpan transplant rejection, conditions related to organ transplant conditions, birth defects, necrotic lesions, wounds, organ transplant rejection, conditions related to organ transplant rejection, conditions related to organ transplant rejection, conditions related to aberrant signal transduction, the present sequence is that of a human protein which is subject to the novel association with the NF-kappaB pathway of the invention. Note: This sequence does not appear in the specification but

US-09-872-185B-9
Sequence 9, Application US/09872185B
Patent No. US20020122799A1
GENERAL INFORMATION:
APPLICANT: Stern, David M.
APPLICANT: Yan, Shi Du
APPLICANT: Yan, Shi Du
APPLICANT: Lamster, Ira
APPLICANT: Lamster, Ira
TITLE OF INVENTION: METHODS FOR TREATING INFLAMMATION
FILE REFERENCE: 0575/64080
CURRENT APPLICATION NUMBER: US/09/872,185B
CURRENT FILING DATE: 2001-06-01
NUMBER OF SEQ ID NOS: 16
SOFTWARE: Patentin version 3.1
SEQ ID NO 9
LENGTH: 50
TYPE: PRT
ORGANISM: Bovine

COUNTRY: USA

ZIP: 02109-2891

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

OOFFATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: PatentIn Release #1.0, Version #1.25

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/385,241

FILING DATE:

CLASSIFICATION: 514

ATTORNEY/AGENT INFORMATION:

NAME: Herschbach Ph.D., Brenda M.

REGISTRATION NUMBER: P-39,223

REFERENCE/DOCKET NUMBER: 492611-000 (MIT6915)

TELECOMMUNICATION INFORMATION:

TELEPHONE: (617) 248-5175

TELEPHONE: (617) 248-5175

INFORMATION FOR SEQ ID NO: 3:

SEQUENCE CHARACTERISTICS:

TENGTH: 114 amino acids
